# Domino Windows

- an extension of '4 Dom'.

In this diagram the four dominoes make a 'window' with one empty space and the spots on each side total nine. (We could say the 'spot sum' in this case is nine.)

What you have to do:

Try to make **seven windows** like this, each having four dominoes, so that all 28 dominoes get used.

Make sure that within a window **each side** has the **same spot-sum**.

Important: Although some windows might have the same spot-sum, they will not all have the same spot-sum – can you explain why?
